4.	<p>Estimate the values of HHVs for the bioresources given in question (1) by using the correlations of question (3) and repeat for finding the mathematical model. Note, referred data in the literature may be used for proximate and ultimate analyses.</p>	CO4																																																																
CO1:	Fundamental understanding of the bioresources and its applications for attainment of social objectives (energy, environment, product, sustainability).																																																																	
CO2:	Acquire knowledge with respect to the properties of the bioresources and the conversion technologies.																																																																	
CO3:	Exhibiting knowledge of the systems used for bioresources and bioresource technology.																																																																	
CO4:	Understanding about analysis of data and their applications in design of the systems and development of the bioprocess.
